Don't expect any innovative designs. Nothing but the most simplistic of ideas. Nearly a complete waste of time and money. If you have spent any time near a container you may have seen the label with weight and measurement information; 99% of the usefull information contained in this pamphlet can be found on those labels. Drawings are repeated and repeated and repeated. That's how to turn 24 pages of nearly useless information into 77 pages.

This is basically a re-print of an invention/patent document and not at all very interesting to a "dude" who's interested in design and new ideas like me. Probably great for an engineer or architect, but not very interesting. That said I did learn something new about how they are recommending siding and paneling on container building.

This book is rightly described as "Expanded discussion of the 1989 Clark shipping container building method patent ... "What it means is that you will pay almost \$10 for a little booklet that shows you an already patented idea (apparently never built because there is not a single picture of the finished product).Build anything as instructed by this manual is automatically patent

infringement!

This book has some very good ideas for designing basic units out of shipping containers. It is filled with good drawings for standard house type buildings and roof plans for each. I would have liked it more if it had had some more creative ideas, but it still gets the point across and gives you some thing to think about and move forward with.

This is a detailed method of converting shipping containers into very serviceable housing. The designs are basic but very well thought out and possible. Certainly a good resource book for anyone thinking of the possibility.

If you are planning on building a shipping container home and looking for information DON'T BUY THIS BOOK. It contains no helpful information about turning a shipping container into a home. It is full of useless information that is repeated over and over. It tells you things like "mount a standard door and window" without ever even attempting to describe how this might be done. The book is nothing more than a description of a patent and contains no information helpful to those who plan on actually building a home or cabin.

serves as a reference the purchase of materials and basic techniques you have idea of implementation and characteristics, which are not taken into account in the background. For people who want more background explanation if having so much practice and know the area is recommended.

The book is worthless babble - I almost returned it, but it is not worth the effort. The useful information in this tiny book is no more than a paragraph worth.
