I'm a metallurgist at a sand casting foundry. I've seen the problems with the conventional system of casting. Although we haven't adopted Campbell's methods wholesale, they make a lot of sense from a theoretical physical metallurgy perspective. The creation of entrainment defects does occur from the interaction of metal and air(oxygen). These oxides have a higher melting temperature than metal and are seen in the end result of the casting process. Quality inspection show tears (though these are often a result of thermal stresses, they still need an origin), slag and sand inclusions that a properly designed filling system should be able to avoid. The text focuses primarily on aluminium alloys. Although it often lacks exact specifics, it is overall a very thorough general guide on the theory of the latest research in the field and with some essential recommendations for improvement.

I found this is a book that any metallurgist should have. By reading this book you can understand Complete Casting Handbook: Metal Casting Processes, Techniques and Design everything about casting a sound part including designing of sprue, runner, gates and feeder.

Brilliant indepth research work Very helpfull in achieving perfection

My son wanted this book for Christmas so I was happy that I was able to find it. Thank you.
